1 Introduction

BC Hydro provides a means for distribution-connected customers to connect a small energy source to the BC Hydro Distribution System to offset their load and participate in the Net Metering program (RS1289) or other energy procurement offers.

This document contains the technical interconnection requirements for connecting small generators to BC Hydro’s Distribution System. The total generation must have an aggregate nameplate rating of 100 kW or less. DGs with generation over this limit should refer to BC Hydro Interconnection Requirements for Power Generators 35 kV and Below.

In this document, customers who are connecting a generator are referred to as Distributed Generator (DG) owners. DG owners must obtain approval from BC Hydro to interconnect their generation to the BC Hydro system.

The requirements outlined in this document are intended to:

- ensure the safety of the customer, BC Hydro personnel, and the public;
- maintain reliability and power quality on the Distribution System; and
- establish the range of operating conditions that DGs will encounter.

The aggregate nameplate rating of the generators at the Point of Common Coupling (or point of delivery) shall not exceed the capacity of the customer’s existing electrical service. The customer may upgrade their electrical service to meet this requirement, at their cost.

Generators are classified into two categories: Simple Distributed Generators and Complex Distributed Generators. The technical and application requirements are simplified for Simple DG, while Complex DG are subject to a full review.

How to use this document

1. Confirm the generator can operate within the Distribution System parameters in Section 2;
2. Determine whether the generator is a Simple or Complex DG, based on the criteria in Section 3.1 and Section 4.1;
3. Refer to the applicable interconnection requirements for Simple DG (Section 3.2) or Complex DG (Section 4.2); and
4. Further information on all standards and references referred to in this document can be found in Appendix A.2. The titles of all standards and references found in Appendix A.2 are italicised.
1.1 Disclaimers

The information contained in this document is subject to future revisions. Important notes of limitations include:

- this document is not a replacement for electrical codes or other applicable standards
- this document is not intended or provided by BC Hydro as a design specification or as an instruction manual for the DG owner, employees or agents, and the document shall not be used by the proponent, his employees or agents for those purposes. Persons using this information do so at no risk to BC Hydro and they rely solely upon themselves to ensure that their use of all or part of this document is appropriate in the particular circumstance,
- the DG owner, employees or agents recognize that they are, at all times, solely responsible for the generator plant design, construction and operation. BC Hydro, its employees or agents shall not be or become the agent of the proponent in any manner howsoever arising,
- the advice by BC Hydro, its employees or agents, that the generating plant design or equipment meets certain BC Hydro requirements does not mean, expressly or by implication, that all or any of the requirements of the law or good Engineering practice have been met by the owner and such judgement shall not be construed by the owner or others as an endorsement of the design or as a warranty by BC Hydro, its employees and agents, of the design or equipment, or any part thereof.

1.2 Revision History

2 BC Hydro Distribution System

Under normal and emergency conditions, BC Hydro’s Distribution System exhibits a range of electrical parameter fluctuations. They are summarized in Table 1. The owner must ensure that the DG System can operate satisfactorily under these conditions and protect itself against excursions outside of these parameter ranges.

</tr>
</tbody>
</table>
3 Interconnecting Simple Distributed Generators

3.1 What Qualifies as a Simple Distributed Generator?
For the purposes of this document, a Simple Distributed Generator (DG) system shall meet all of the following:

- be an inverter-based system installed in accordance with Canadian Electrical Code (CEC) Part I and certified to the requirements of CSA C22.2 No. 107.1-01 for utility interconnection; and
- has an aggregate nameplate rating of 27 kW or less (30 kVA at 0.9 power factor) at the Point of Common Coupling (or point of delivery); and
- has self-contained revenue metering (services 200 A or less, and not 600V, 3 Phase, 3 Wire, Delta services).

3.2 Requirements
This section provides the technical requirements to be met by any Simple DG System that will be interconnected with the Distribution System.

3.2.1 Equipment

General
As applicable, Simple DG Systems shall meet:

- CEC Part I (see Sections 50, 64 & 84)
- CAN/CSA-C22.2 No. 257-06
- CAN/CSA-C22.3 No. 9-08
- CSA C22.2 No. 107.1-01

Point of Common Coupling
The Point of Common Coupling (PCC) is the point where the Distribution System and the DG owner’s installation interconnect. This is typically at the weatherhead (for overhead service connections) or at the revenue meter base (for underground service connections). BC Hydro is responsible for design, construction, maintenance, and operation of all facilities on the BC Hydro side of the PCC. The DG owner shall be responsible for design, construction, inspection, maintenance, and operation of all facilities on their side of the PCC.

DG System Disconnect Means
All generators interconnected with the Distribution System require a means to safely disconnect them and ensure isolation in accordance with CEC Part I, Section 84. BC Hydro does not specify the physical location of the customer’s means of disconnection.

As per CEC Part I, Section 84-030, the DG shall install a warning label at the revenue meter location and at the Disconnect Means, and a single-line, permanent, legible diagram of the interconnected system shall be installed in a conspicuous place at the disconnecting means.
3.2.2 Protection

The generator protection shall be in accordance with CEC Part I and Table C.2 in Appendix C.

Anti-islanding

The anti-islanding requirements of CAN/CSA-C22.2 No. 257-06 and CSA C22.2 No. 107.1-01 requires the inverter to cease energizing the Distribution System within 0.1 seconds upon loss of the BC Hydro supply, as specified in Table C.3. This provides for the safety of electrical workers and the public.

Grid-dependent inverters are designed to only energize when the utility (BC Hydro) supply is present, but grid-interactive inverters can also operate in stand-alone (sometimes called off-grid) mode and must be verified to be in grid-dependent mode. A grid-interactive inverter may contain the internal disconnects and transfer switch to ensure isolation from the BC Hydro Distribution System while still supplying an essential load panel. Please see Appendix A.1 for more detailed definitions.

3.2.3 Power Quality

Inverters certified to the requirements of CSA C22.2 No. 107.1-01 for utility interconnection meet the power quality requirements for connection to the Distribution System.

3.2.4 Commissioning & Operation

General

The DG owner is required to confirm that all requirements of the manufacturer and Local Regulatory Authority are met, and that the DG System installation meets the requirements of this document and CSA C22.2 No. 257-06. If requested, the DG owner will provide to BC Hydro a list of step-by-step energizing and commissioning procedures prior to DG system commissioning.

The DG owner shall retain a complete set of manuals, installation drawings, permits, inspection and verification test reports and make them available to BC Hydro if requested.

Testing & Commissioning

Prior to completion of DG System commissioning, or whenever the generator system is modified, a verification test shall be performed as recommended by the equipment manufacturer and required by CAN/CSA-C22.2 No. 257-06 Section 7. Testing of the DG System shall include procedures to functionally test all protective elements including verification of inverter trip timing.

Maintenance & Operation

In addition to keeping all equipment well maintained and functional, the DG owner shall verify the generator’s interconnection protective functions according to the manufacturer’s recommended schedule, or at least once a year as required by CAN/CSA-C22.2 No. 257-06 Section 8. If there is no manufacturer’s recommendation, operation of the disconnecting means and verifying that the inverter system automatically ceases to energize is an acceptable method of verification. Maintenance records shall be maintained. Failure to perform and record maintenance can result in disconnection of the DG facility.

The DG owner must notify BC Hydro of any subsequent changes to equipment, by submitting a revised Interconnection Application form, to confirm that the proposed equipment modification still meets the requirements to qualify as a Simple DG.
4 Interconnecting Complex Distributed Generators

4.1 What Qualifies as a Complex Distributed Generator?

The increased complexity and potential for impact on the Distribution System requires that Complex Distributed Generators (DG) be subject to a more rigorous review than Simple DG.

For the purposes of this document, a small generator system will be deemed a Complex DG if it meets any of the following conditions:

- is an inverter-based DG Systems that are not certified to the requirements of *CSA C22.2 No. 107.1-01* for utility interconnection; or
- has an aggregate nameplate rating greater than 27 kW and less than or equal to 100 kW at the Point of Common Coupling (or point of delivery); or
- is an induction or synchronous generator; or
- has instrument transformer revenue metering (services greater than 200 A, or 600V, 3 Phase, 3 Wire, Delta services).

Typically, the main distinction between Simple DG Systems and Complex DG Systems is that for Complex DG Systems the protection and isolation functions are not connected into factory assembled, tested, and certified single enclosure units with non-adjustable settings.

4.2 Requirements

This section provides the technical requirements to be met by any Complex DG System interconnecting with the Distribution System.

Application data requirements for Complex DG Systems are given in Appendix E. BC Hydro reserves the right to request that the application documents and drawings be sealed by a Professional Engineer registered in the Province of British Columbia.

4.2.1 Equipment

4.2.1.1 Common Requirements

General

As applicable, Complex DG Systems shall meet:

- *CEC Part I (see Sections 50, 64 & 84)*
- *CAN/CSA-C22.2 No. 257-06*
- *CAN/CSA-C22.3 No. 9-08*
- *CSAC22.2 No. 107.1-01*
**Point of Common Coupling – Responsibilities and Quantity Measurement**

The Point of Common Coupling (PCC) is the point where the Distribution System and the DG owner’s installation interconnect. This is typically at the weatherhead (for overhead service connections) or at the revenue meter base (for underground service connections). BC Hydro is responsible for design, construction, maintenance, and operation of all facilities on the BC Hydro side of the PCC. The DG owner shall be responsible for design, construction, inspection, maintenance, and operation of all facilities on their side of the PCC.

The typical measurement locations of voltage and frequency for protection functions are shown in Table C.8.

**Point of Disconnection - Safety**

All generators interconnected with the Distribution System require a means to disconnect them and ensure isolation in accordance with CEC Part I, Section 84. Typically, BC Hydro does not specify the location of the customer’s means of disconnection, except as noted below for instrument transformer metering.

As per CEC Part I, Section 84-030, the DG shall install a warning label at the revenue meter location and at the Disconnect Means, and a single-line, permanent, legible diagram of the interconnected system shall be installed in a conspicuous place at the disconnecting means. Where instrument transformers are used for revenue metering, the revenue meter and the instrument transformer enclosure each require a warning label.

According to Section 5 of BC Hydro Requirements for Secondary Voltage Revenue Metering (750 V and less), DG Systems containing instrument transformer metering shall provide a main service box with the customer main disconnect on the supply side of the instrument transformer compartment, and a lockable disconnect on the load side of the instrument transformer enclosure.

DGs with primary metering shall meet the requirements in Requirements for Manually Read Primary Service Voltage Revenue Metering – 4 kV to 35 kV.

DG Systems that have potential for hazardous infeed (i.e. can continue to deliver power to the Distribution System after the system has been de-energized for greater than two seconds) require a facility specific Distribution Operating Order (DOO) to be prepared by the BC Hydro Control Centre to describe procedures for interconnected operation. This requirement applies to all synchronous generators and induction generators that are capable of self-excitation.

**Voltage Regulation**

The DG System shall not attempt to regulate the voltage and shall not adversely affect voltage at the PCC. BC Hydro will determine if voltage regulation is expected to be a concern and identify solutions during the technical review.

**Power Factor**

The Complex DG System is not required to adjust its power factor (PF) but shall be capable of operating in the range of ±0.90 PF. If the Complex DG causes the Distribution System to operate outside normal voltage levels at the PCC (see Table C.1 - for the Distribution System voltage variation limits), then the owner may be required to operate the DG System within a narrower PF range or take other compensatory measures.
Interconnection Grounding

In accordance with CSA C22.3 No. 9-08, DG Systems must be grounded as per manufacturer’s recommendations and CEC Part I. The transformer grounding must be coordinated with BC Hydro to ensure it does not cause voltage disturbances and coordination of ground fault protection is maintained.

Interrupting Device Ratings

The design of the DG System must consider the fault current contributions from both BC Hydro and the DG System, to ensure that all circuit fault interrupters are adequately sized. If requested, BC Hydro will inform the DG owner of the present and anticipated future fault current contribution from the Distribution System at the PCC.

4.2.1.2 Special Requirements: Induction Generators

BC Hydro may require induction generators to provide reactive compensation (PF correction capacitors) to ensure the generator operates within a PF range of ±0.9. Conditions on the Distribution System, as well as the addition of reactive compensation, may increase the potential for self-excitation. If self-excitation is determined to be a credible possibility, mitigation measures will be required by BC Hydro.

4.2.1.3 Special Requirements: Customer Owned Transformers

Customers with a PCC voltage greater than 750 V must provide their own transformer and must connect their DG System to the low voltage side. BC Hydro prefers a transformer connection that is grounded-wye on the high voltage (BC Hydro) side, and a delta on the low voltage (DG System) side, but other configurations with their associated protection schemes may be approved. Please refer to Annex C in CSA C22.3 No. 9-08 and BC Hydro Interconnection Requirements for Power Generators 35kV and Below for further information.

4.2.1.4 Special Requirements: Inverter-based DG Systems

BC Hydro requires that inverter-based DG Systems are certified to the requirements of CSA C22.2 No. 107.1-01 for utility interconnection. At BC Hydro’s discretion, a non-certified inverter may be allowed where the inverter is satisfactory to BC Hydro and the DG retains a Professional Engineer who designs, tests and signs off on the inverter system.

4.2.2 Protection – Inverter-Based Systems

The DG System shall be equipped with the required protective equipment outlined in Table C.2 in Appendix C.

Anti-islanding

The anti-islanding requirements of CAN/CSA-C22.2 No. 257-06 and CSA C22.2 No. 107.1-01 require the inverter to cease energizing the Distribution System within 0.1 seconds upon loss of the BC Hydro supply, as seen in Table C.3. This provides for the safety of electrical workers and the public.

All inverter-based systems, including those not certified to CSA standards, must meet this anti-islanding requirement.
Overcurrent Protection
The DG System must detect and promptly cease to energize the Distribution System for any phase-to-phase or phase-to-ground overcurrent fault conditions in the DG System.

Under-Voltage and Over-Voltage Protection
Under-voltage and over-voltage protection is required to disconnect the DG System when the Distribution System operates outside of its normal operating range. The under-voltage and over-voltage conditions and pre-set delay times are shown in Table C.3.

Single-phase systems shall monitor either the phase-to-neutral or phase-to-phase voltage, based on equipment configuration. Three-phase systems shall monitor all individual phase-to-neutral voltages on a grounded-wye system or any individual phase-to-phase voltage on an ungrounded-wye or delta system. Settings for under- and over-voltage protection outside of the parameters of Table C.3 will need approval from BC Hydro.

Under-frequency and Over-frequency Protection
Under-frequency and over-frequency protection with adjustable set points is required, to disconnect the DG System, when the Distribution System operates outside of its normal operating range. The under-frequency and over-frequency conditions and pre-set delay times are shown in Table C.5.

For three-phase systems, only one phase must be monitored. At least one adjustable under-frequency setting and one over-frequency setting with adjustable clearing time is required.

Synchronization
Inverter-based systems capable of standalone operation must meet the flicker requirements outlined in Section 2 when they synchronize to the Distribution System. The DG System must not re-energize or synchronize to the Distribution System until the BC hydro system is stable.

4.2.3 Protection – Induction and Synchronous Generators
The DG System shall be equipped with the required protective equipment outlined in Table C.2. If the protective equipment is compliant with IEEE Std C37.90-2005, it does not need to be tested and approved by BC Hydro.

The DG System shall cease energizing the Distribution System without delay when either the protection system or its auxiliary power source fails. The DG owner shall demonstrate that protection system (relay or breaker) failure has been mitigated using self-diagnostic features, redundancy, or fail-safe design.

Anti-islanding
Section 84 of CEC Part I requires automatic disconnection of the generator upon loss of voltage on the Distribution System. This provides for the safety of electrical workers and the public. Such anti-islanding protection for DG Systems is provided via the under-/over-voltage and under-/over-frequency protective equipment detailed below.

Scenarios where induction generators might resonate with Distribution System capacitor banks will require instantaneous over-voltage protection.

Overcurrent Protection
The DG System must detect and promptly cease to energize the Distribution System for any phase-to-phase or phase-to-ground overcurrent fault conditions in the DG System.
Under-Voltage and Over-Voltage Protection

Under-voltage and over-voltage protection is required to disconnect the DG System when the Distribution System operates outside of its normal operating range. The required under-voltage and over-voltage conditions and pre-set delay times are shown in Table C.7.

Single-phase systems shall monitor the phase-to-neutral or phase-to-phase voltage, based equipment configuration. Three-phase systems shall detect all individual phase-to-neutral voltages on a grounded-wye system, or any individual phase-to-phase voltage on an ungrounded-wye or delta system. Using settings outside of the parameters listed in Table C.7.

Under-frequency and Over-Frequency Protection

Under-frequency and over-frequency protection with adjustable set points is required to disconnect the DG System when the Distribution System operates outside of its normal operating range. The under-frequency and over-frequency conditions and pre-set delay times are shown in Table C.6. For three-phase systems, only one phase must be monitored. At least one under-frequency setting and one over-frequency setting with adjustable set points and clearing time are required.

Synchronization

Synchronous generators must be equipped with automatic synchronizing capabilities to be connected in parallel with the Distribution System. The DG System may only synchronize when the Distribution System is stable, and must meet the flicker requirements of Table 1 without causing a voltage variation at the PCC greater than 5%. The synchronization device must be capable of matching the DG System output within 0.3 Hz of the Distribution System frequency, 10% of the Distribution System voltage, and 20 degrees of the Distribution System phase angle.

Induction generators do not require synchronization capabilities since there is no generated voltage prior to connecting to the Distribution System. However, the generator speed should be brought to within 0.5% of its rated value before being connected. Induction generators may be started as induction motors using power from the Distribution System provided they do not cause unacceptable voltage flicker on start-up or on connect/disconnect.

4.2.4 Power Quality

Harmonic Distortion

Complex DG Systems must comply with the limits from CAN/CSA-C22.3 No. 9-0, as listed in Table C.4. Total current harmonic distortion shall not exceed 5% of rated current.

DC Current Injection

In accordance with Clause 10.5.3 of CSA C22.2 No. 107.1-01, DG Systems “shall not inject a DC current greater than 0.5% of the unit rated output current after a period of six cycles” following connection to the Distribution System.
4.2.5 Commissioning & Operation

General

The DG owner is required to confirm that all requirements of the manufacturer, Local Regulatory Authority and applicable standards are met. Installation, commissioning and maintenance must be performed by qualified personnel with the DG keeping signed copies of the commissioning & test reports.

BC Hydro needs to perform field verification for some Complex DG Systems (see Table D.1 for specifics). Accordingly, the DG owner shall notify BC Hydro at least 10 business days (or 20 business days during the winter period of December to February) before the initial energizing and start-up testing of the DG.

If field verification is required, BC Hydro will provide a Declaration of Compatibility (DoC) that will have to be completed prior to commencing operations (see Appendix F).

Testing & Commissioning

All commissioning tests shall be conducted after the DG System is ready for operation and BC Hydro has approved the protection settings (magnitude and time delay) applied to overcurrent and power quality protection relays. Prior to completion of DG system commissioning, or whenever the generator system is modified, a verification test shall be performed as recommended by the equipment manufacturer.

Verification testing for inverter-based DG shall be done according to CAN/CSA-C22.2 No. 257-06 (see Table D.2 for more detail). Verification testing for DG using induction or synchronous generators must be done according to CSA C22.3 No. 9-08 Section 8 (see Table D.3 for more detail).

The documentation required by BC Hydro at the commissioning stage is listed in Table D.4.

Maintenance & Operation

In addition to keeping all equipment well maintained and functional, the DG owner shall verify the generators protective functions according to the manufacturer’s recommended schedule, or at least once a year as required by CAN/CSA-C22.2 No. 257-06 Section 8 and CSA C22.3 No. 9-08 Section 8. Maintenance records shall be maintained. Failure to perform and record maintenance can result in disconnection of the DG facility.

The DG owner must notify BC Hydro of any subsequent changes to equipment, by submitting a revised Interconnection Application form.
Appendix A: Definitions and References

A.1 Definitions and Acronyms

Canadian Standards Association (CSA): An accredited standards development organisation within Canada.

Cease to Energize: To stop and remove the capability to deliver electrical power to the Distribution System.

Clearing Time: The time from the start of the abnormal condition to when the Distributed Generation ceases to energize the Distribution System.

Disconnecting Means: A device, group of devices, or other means whereby the conductors of a circuit can be disconnected from their source of supply.

Distributed Generation (DG): Electric power generation facilities connected to the BC Hydro Distribution System through the Point of Common Coupling.

Distributed Generation Owner (DG Owner): Any legal entity responsible for the DG System interconnected to the Distribution System for the purpose of generating electric power.

Distributed Generation System (DG System): The aggregate of the Distributed Generation electricity generator, inverter(s), control system(s), sensing device(s) or function(s), and protection devices and functions to the customer service entrance disconnect switch.

Distribution System: That part of the BC Hydro system that operates at 34,500 V or less and distributes electric power between BC Hydro substations and Points of Common Coupling.

Generator: Equipment that produces electric power. (Note: The inverter is recognized as being a “generator” from the perspective of the Distribution System)

Interconnection: The result of the process of electrically connecting a Distributed Generation System in parallel with the Distribution System.

Interconnection System: The collection of all interconnection equipment, including the utility interconnected inverter, and functions, taken as a group, used to interconnect a Distributed Generator to the rest of the customer’s facilities. The interconnection system can be internal to the Distributed Generation System (see Figure B.1).

Inverter: A power electronic device, which converts DC power into AC power.

Grid-Tied Inverter (also known as Grid-connected Inverter): An inverter that is able to operate in grid-parallel mode (in which an inverter operates in parallel with the Distribution System and contains provision for synchronising its voltage, phase, and frequency to the Distribution System).

Grid-Dependent Inverter: A type of Grid-Tied Inverter that operates only in grid-dependent mode (in which an inverter operating in grid-parallel mode depends on BC Hydro's distribution facility to initiate and maintain its operation). As per CSA C22.2 No. 107.1-01, Section 15.3.5.4, a Grid-Dependent Inverter must cease to deliver power within 2 seconds of loss of the grid.

Grid-Interactive Inverter: A type of Grid-Tied Inverter that is able to operate in both stand-alone mode (in which an inverter operates in isolation from BC Hydro's distribution facility, and generates its own voltage, phase, and frequency conditions (i.e. self-commutated) and grid-
parallel mode (see “Grid-Tied Inverter” definition) according to the availability of BC Hydro’s distribution facility.

**Island:** A condition in which a portion of the Distribution System is energized by one or more Distributed Generation Systems while that portion of the Distribution System is electrically separated from the rest of the Distribution System.

**Local Regulatory Authority:** The ministry or local government which provides for an inspection service and has authority to require inspection of electrical work in an area of British Columbia.

**Load Ratio:** Ratio of the secondary voltage system average load (kVA) of all load customers on the secondary system to the aggregate maximum rated output (kVA) of the Distributed Generation Systems on that secondary system. This does not apply where a dedicated distribution transformer supplies the Distributed Generation customer. This is a measure of the risk of the Distributed Generation Systems for islanding the secondary system if it becomes isolated from the rest of the Distribution System.

**Parallel Operation:** The simultaneous energization of a Point of Common Coupling by the Distribution System and the Distributed Generation System.

**Point of Common Coupling (PCC):** The point at which the BC Hydro and the customer interface occurs.

**Point of DG Connection:** The point where an interconnection system is electrically connected to the DG owner’s facility. The point of DG connection can be the same as the Point of Common Coupling (see Figure B.1).

**Protection Scheme (or protection system):** The protection functions, including associated sensors, relaying, and power supplies, intended to protect the distribution system or interconnection equipment.

**Stable or Stabilized:** Refers to the Distribution System voltage returning to the normal range of level and frequency for five minutes or a time as co-ordinated with BC Hydro, following a disturbance.

**Stiffness Ratio \( (I_{sc}/I_{load}) \):** Ratio of the Distribution System fault current at the Point of Common Coupling to the aggregate maximum rated output current of the DG System at the customer site. This is a measure of the risk of the DG System causing problems with voltage flicker, steady-state voltage regulation or harmonics.

**Total Harmonic Distortion (THD):** A measure of the total sum of squares of harmonic frequency signals compared to a fundamental frequency signal.

**Utility Grade Relay:** Relay having the same quality as those relays used by BC Hydro to protect its system. Utility grade relays are designed to provide the highest degree of reliability, repeatability, longevity, security and calibration accuracy. Such relays meet the performance tests and specifications in IEEE Std C37.90-2005.

**Voltage Flicker:** A variation in Distribution System voltage large enough to be perceived as an objectionable change of intensity from a light bulb.

**Voltage Follower Mode:** An inverter operation mode that follows the waveform of an external source and depends on the external source to initiate and maintain its operation while delivering power to that source.

**Wires Owner (BC Hydro):** The legal entity responsible for the Distribution System.

Appendix B: Figures and Single Line Diagrams

Figure B.1 – Relationship between DG System and Other Interconnection Terms
(Source: Adapted From CAN/CSA-C22.2 No. 257-06 Figure 1)
Figure B.2 – Single Line Diagram of a Typical Inverter-Based Simple or Complex DG System
(Source: Adapted From CAN/CSA-C22.2 No. 257-06 Figure B.1)

Notes:
1. Some BC Hydro customers have a separately metered sub panel for electric heating (i.e. E-Plus panel - rate schedule RS 1105). No DG shall be connected to an E-plus panel.
2. This is a warning notice required by Clause 84-030 of the CEC Part I. BC Hydro requires that the notice should be a permanent label suitable for outdoor conditions, with black letters on a white background, of a size and wording as indicated in Figure B.4. The notice must be mounted on the meter base (box), or if there is no meter base on the wall within 0.3 m (1 ft) of the meter.
3. Protection functions shown shall be internal for the inverter.
4. Elements shown with dashed line (- - -) are not typical for every installation.
Notes:

1. Some BC Hydro customers have a separately metered sub panel for electric heating (i.e. E-Plus panel - rate schedule RS 1105). No DG shall be connected to an E-plus panel.
2. This is a warning notice required by Clause 84-030 of the CEC Part I BC Hydro requires that the notice should be a permanent label suitable for outdoor conditions, with black letters on a white background, of a size and wording as indicated in Figure B.4. In addition, where a DOO is required, an additional label “Potential for hazardous infeed – Refer to DOO” is required. The notice must be mounted on the meter base (box), or if there is no meter base on the wall within 0.3 m (1 ft) of the meter.
3. Protection schematic shown is for typical Complex DG Systems. Refer to Section 4 for requirements on specific systems.

**Notes:**

1. For interconnection of 1 and 3 phase generation units connected at 600 volts or less in accordance with **CEC Part I**.
   - Y = required, not adjustable; A = required, adjustable set points in accordance to **Table C.3** and **Table C.5**.
2. Number of phases monitored shown in parentheses, e.g. (3).
3. For inverters with standalone capability.
4. 50/51 functions may be met by fuses or circuit breaker.
Table C.3 – Inverter-Based DG Response to Abnormal Voltage Levels

<tr>
<td>V &gt; 120%</td>
<td>Instantaneous</td>
<td>V &gt; 120%</td>
<td>Instantaneous</td>
</tr>
</tbody>
</table>

Notes:
1. 27 kW was chosen as representing CSA’s 30 kVA x 0.9 power factor.
2. The CSA standard allows a wider normal voltage range than Table C.1 - to allow line regulation equipment time to function. Field adjustable settings for Complex DG Systems may be required to improve protection. Field adjustable settings are to be adjusted by qualified personnel only.

Table C.4 – Maximum Harmonic Current Distortion

<td></td>
</tr>
<tr>
<td>35 ≤ h</td>
<td></td>
</tr>
<tr>
<td>Distortion, Percentage of Current</td>
<td>4.0%</td>
</tr>
</tbody>
</table>

Notes: The current specified in this Table is the greater of:

a) The Distribution System maximum load current integrated demand (15 or 30 min) without the DG; or
b) The DG unit rated current capacity, transformed at the PCC when a transformer exists between the DG unit and the PCC.

The maximum distortion values specified in this Table are for odd harmonics. To obtain maximum distortion values for even harmonics, the value in the corresponding h-range shall be multiplied by 25%

<td>88% ≤ V &lt; 106%</td>
<td>Nominal Operation</td>
</tr>
<tr>
<td>106% &lt; V ≤ 120%</td>
<td>2.0 s</td>
</tr>
<tr>
<td>V &gt; 120%</td>
<td>Not to exceed 0.16 s</td>
</tr>
</tbody>
</table>

**Notes:**
1. Nominal system voltage shall be in accordance with Clause 6.2 of CAN/CSA-C22.3 No. 9-08.
2. Specific clearing times within the ranges in this Table may be specified by BC Hydro. Other clearing times or voltage ranges may be arranged through consultation between the DG Owner and BC Hydro.
3. Instantaneous means no intentional delay.

</tbody>
</table>

Notes:

BC Hydro may approve exceptions to this table

1. Inverter-based systems generally have built-in protection functions which inherently measure at their AC terminals.
2. Primary Voltage connection is defined as having a voltage greater than 750 V at the PCC.
3. The protection function to detect ground faults on the Distribution System (59G) must measure the primary side of transformer.
4. Primary Side of the transformer is the side connected to the BC Hydro Distribution System.

</table>

Notes:

1. *Field verification is not required for Simple DG Systems*
2. Field verification for Complex DG Systems is at the discretion of BC Hydro
3. Based on System Stiffness Ratio or Load Ratio
   - Required when System Stiffness Ratio is < 100 for inverter-based Complex DG Systems,
   - < 50 for other Complex DG Systems
   - Required when the Load Ratio is < 2.0

Appendix E: Application Data Requirements

Applicant Information:
- Company Name
- Last Name
- First Name
- Phone
- Email Address
- Street Address
- City
- Postal Code
- GST # (if applicable)
- Signature

DG Site Information:
- Site Name
- Street Address
- City
- Postal Code
- Service Voltage (V)
- Service Size (Amps)
- BC Hydro Account #
- BC Hydro Meter Number #
- Is this application for a new Generation System, of a modification of an existing system [New/Modification]

Contractor or Installer Information:
- Company Name
- Last Name
- First Name
- Phone
- Email Address
- Street Address
- City
- Province
- Postal Code
Information for Simple Distributed Generator Systems:
A project will be considered as a Simple if all the following are met:
- Inverter system certified to the requirements of CSA C22.2 No. 107.1-01 for utility interconnections
- Aggregate generator nameplate rating of 27 kW or less
- Has self-contained revenue metering
- (services 200 A or less, and not 600V, 3 Phase, 3 Wire, Delta services

☐ Inverter certified under CSA C22.2 No. 107.1-01 [Y/N]
☐ Inverter Manufacturer
☐ Inverter Model
☐ Inverter Nameplate Capacity (kW)
☐ Inverter Output Voltage (V)
☐ Number of Phases [Single/Three]
☐ Energy Source [Solar/Wind/Hydro/Other(specify)]
☐ Installed Capacity of Energy Source (kW)
☐ Does the system include Battery Storage [N/Y (specify)]

Information for Complex Distributed Generator Systems:
A project will be considered as a Complex if any of the following are met:
- Inverter-based system not certified to the requirements of CSA C22.2 No. 107.1-01 for utility interconnections
- Aggregate nameplate rating of more than 27 kW
- Induction or synchronous generator
- Has instrument transformer revenue metering

Synchronous or Induction Generator System:
☐ Generator Type [Induction/Synchronous]
☐ Generator Manufacturer
☐ Generator Model
☐ Generator Nameplate Capacity (kW)
☐ Generator Power Factor (p.f.)
☐ Generator Output Voltage (V)
☐ Number of Phases [Single/Three]
☐ Generator Subtransient Reactance (Xd")
☐ Protection Relay(s) (Manufacturer/Model/Functions/Settings)
☐ Energy Source [Solar/Wind/Hydro/Wind/Other (specify)]
☐ induction Generator – Applicant declares generator is not self-exciting (Y/N)
☐ induction Generator – Power Factor Correction Capacitor Size (kVAR)

Inverter-Based System:
☐ Inverter certified under CSA C22.2 No. 107.1-01 [Y/N] (If no, explain)
☐ Inverter Manufacturer
☐ Inverter Model
☐ Inverter Nameplate Capacity (kW)
☐ Inverter Output Voltage (V)
☐ Number of Phases [Single/Three]
☐ Energy Source [Solar/Wind/Hydro/Other(specify)]
☐ Installed Capacity of Energy Source (kW)
☐ Does the system include Battery Storage [N/Y (specify)]
Additional Documentation Required for Complex Distributed Generator Systems:

1. **Single Line Diagram** showing:
   - Project Title, Date, Revision Number, Site Address, Name of Person or Firm that prepared drawing
   - Differentiation between new and existing equipment (Cloud or dividing line)
   - All switches, breakers, and relays shall have distinct identifiers or names
   - Service Entrance equipment
   - BC Hydro revenue meter and, if applicable, revenue metering instrument transformers (CTs and PTs) and E-Plus Meter
   - All electrical equipment between the Service Entrance and the generator (switches, breakers, cables, etc.).
   - Location of DG Disconnect means
   - Location of warning labels as required by *CEC Part I*
   - Generator/Inverter nameplate information and model numbers

2. **Site Plan** showing:
   - Project Title, Date, Revision Number, Site Address, Name of Person or Firm that prepared drawing
   - Plan view of the site, with nearby roads
   - Location of PCC, BC Hydro Metering, Electrical Panels, and generator/inverter.
   - Location of DG Disconnect Means
   - Equipment names, which match the single line drawing
   - Site Plan does not need to be to scale

3. **Additional Documentation**

   **Induction or Synchronous Generators:**
   - Generator data sheet showing nameplate information
   - Description of Project Protection and Control System (Logic block diagram or narrative)
   - Description of Protection failure scheme (See 4.2.3)
   - Protection Single Line Diagram showing: Protective relays, relay functions, and protection functions that trip mechanical equipment (such as a protection function failure scheme)
   - Description of the generator starting sequence (logic block diagram or narrative)

   **Inverters:**
   - Protection Settings
   - Inverter data sheet showing nameplate information and certification to CSA standards
